## - Movie Insight - Basic Info

[home](#) [search prediction](#) [movie search](#) [myPrediction](#)

Welcome anonymous123

This is the Movie Insight web app! We take information from OMDB api and then 'shake and bake' a prediction about new movies based off of other movies's actors, directors, and other people have starred in.

Motivation -

This software assists with evaluating new movies and users can straightforwardly make a decision whether to order a tickets in advance or wait until it appears on Netflix.

[about us](#) [basic info](#) [contact](#)

add whatever you want to  
'liven' it up :)

there is a bottom nav menu.  
all the pages should have a  
similar look

[login](#)

## - Movie Insight - About Us

[home](#) [search prediction](#) [movie search](#) [myPrediction](#)

Welcome anonymous123

We believe that great talent will do great work, so we invest in people and give them the opportunity to shine. It's our guiding philosophy, our promise, and our business model. We:

- Craft provocative experiences.
- Push beyond the comfort zone.
- Take risks to move things forward.
- Create work that others point to and think "I wish I'd done that."
- Stay away from cookie-cutter solutions, because one size rarely fits all.

User case Admin function

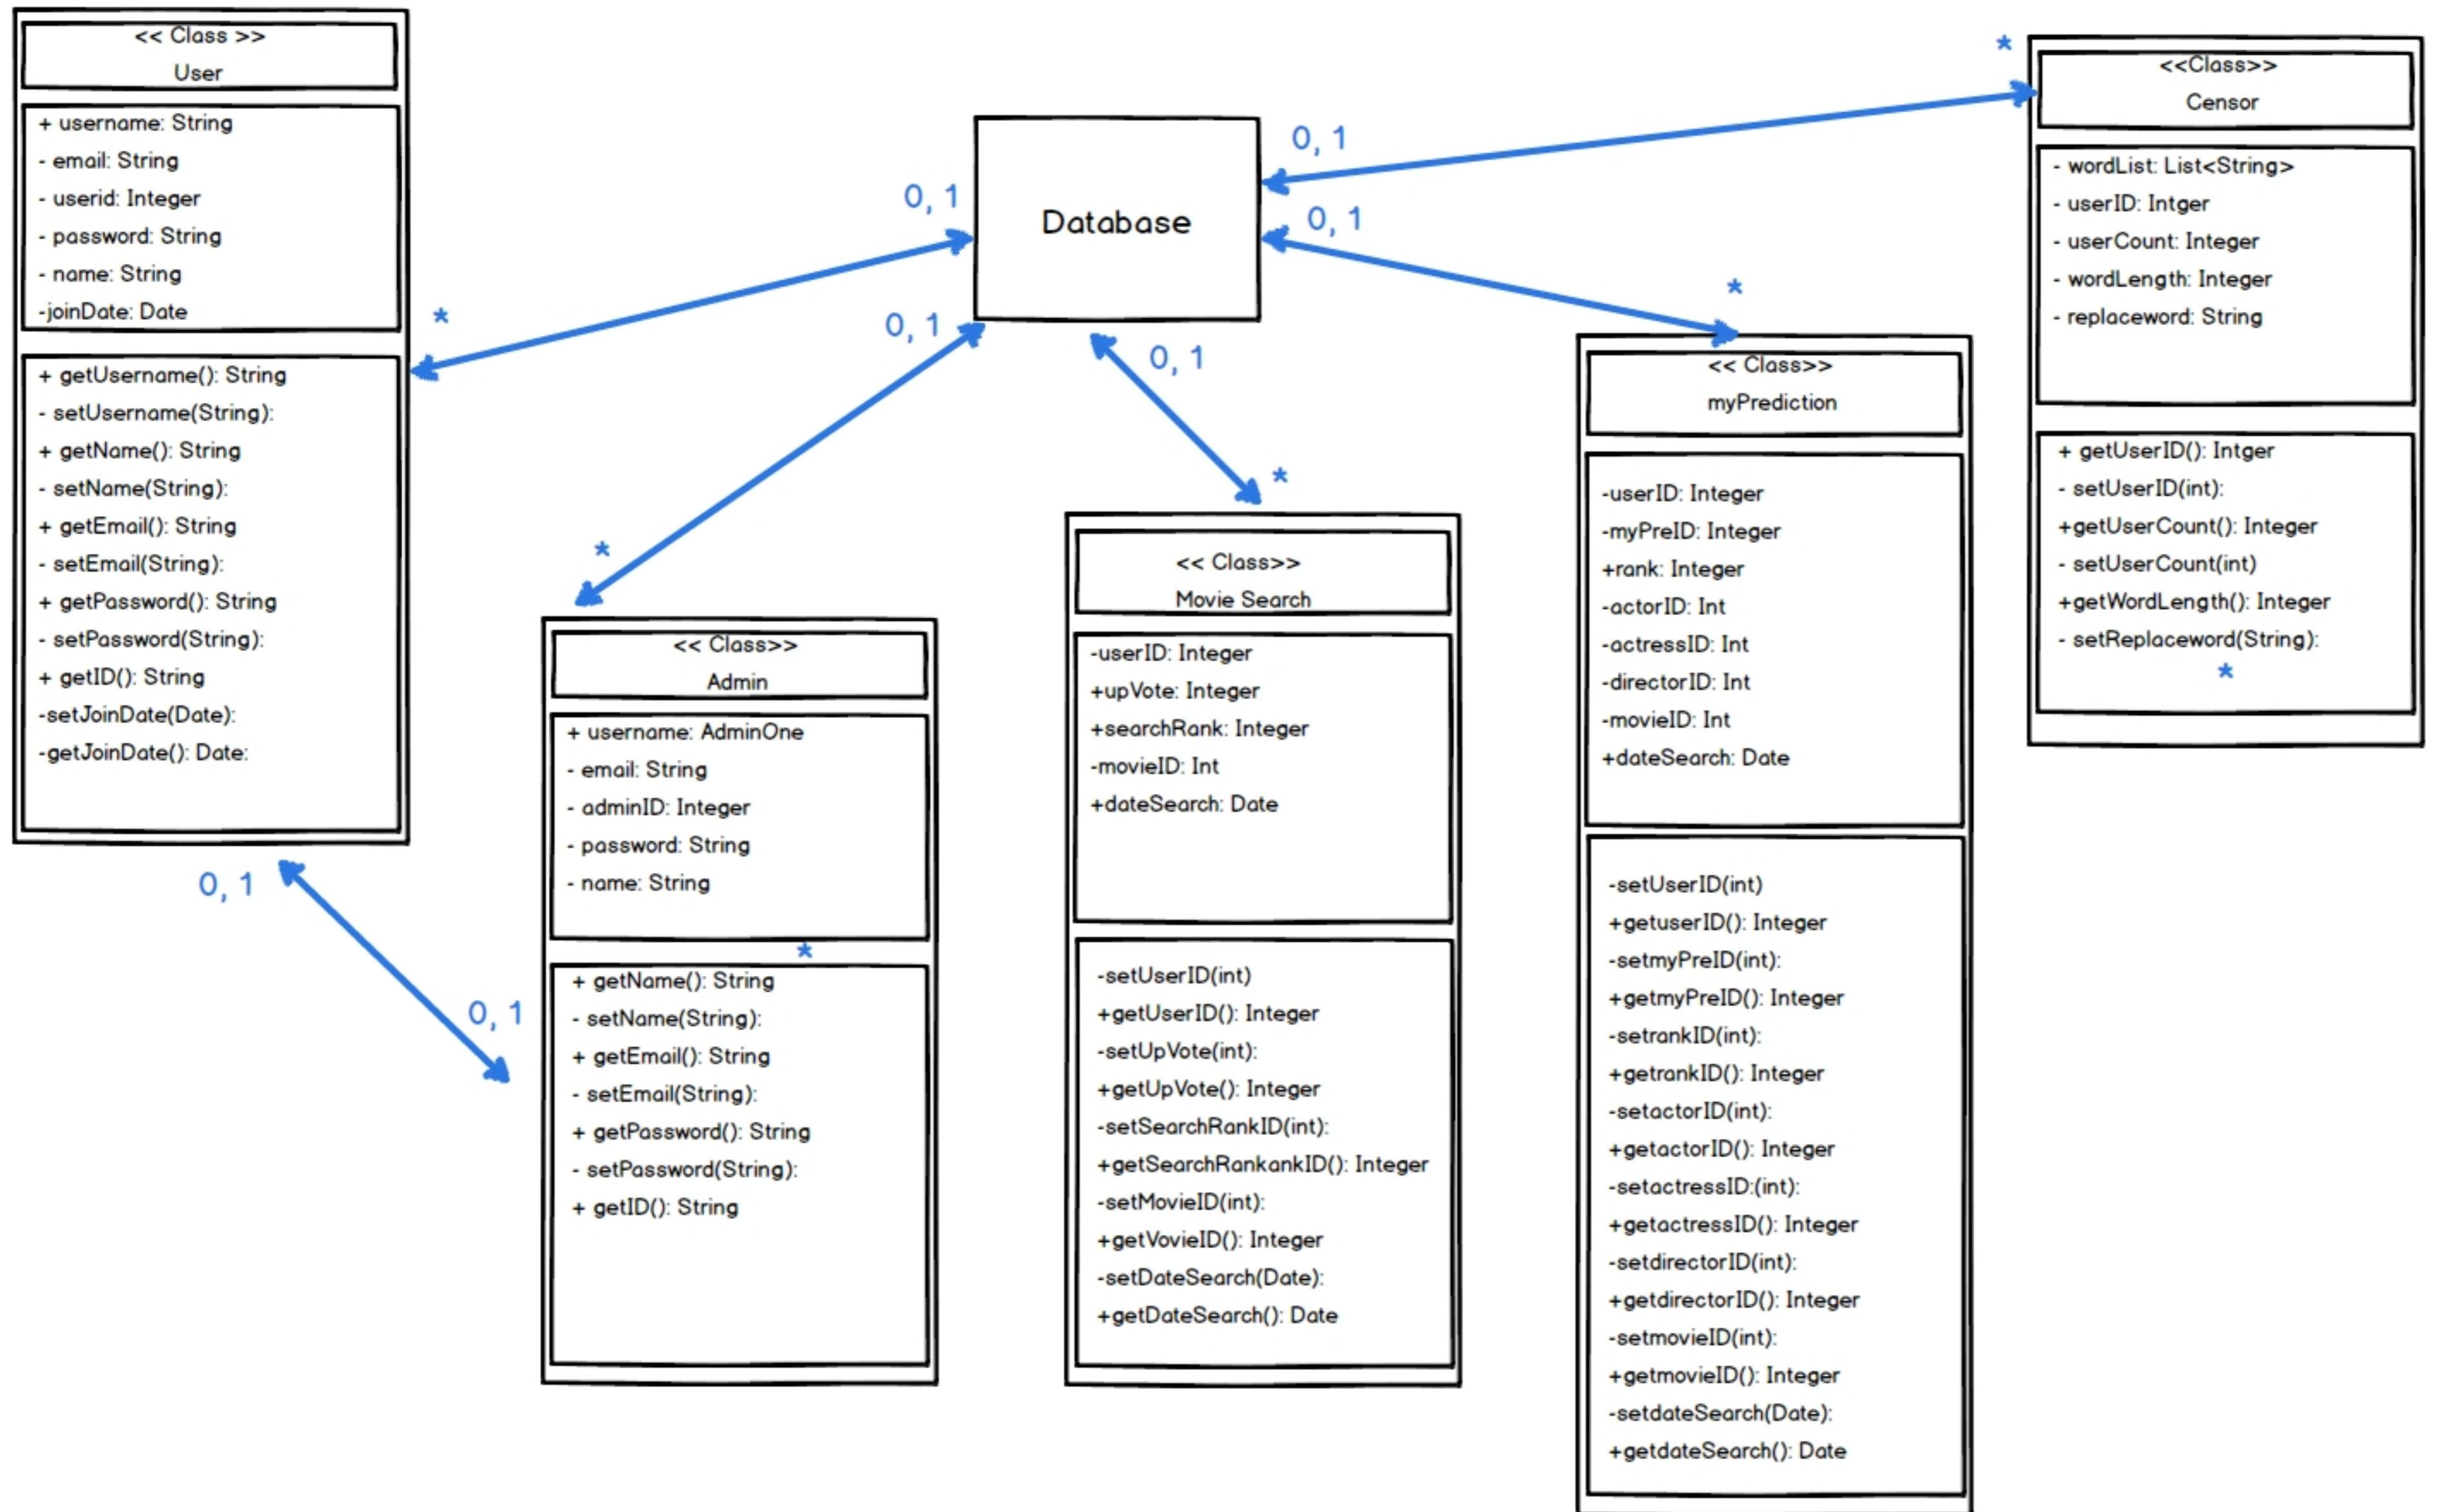

Once a User registers and the admin logs in, the admin may delete the user, examine a users info, edit a user info, and display various App reports from within the App. The user's registration ans Admin changes are saved to the DB.

#### User case App search

User register, logins, input info into the form, and submits. App accesses the DB to see if the search criteria has been executed in the past. App request from the movie database, a response dataset is returned, dataset is recorded, and a callback to the search result. Registered user search data and result is stored in the DB as myPrediction. This allows the chat function to be used, the App censors text for profanity, and returns altered text to the chat screen. Also, if the User wishes the upvote the search results that bubbles the results to be stored in top prediction ranking. Guest are able to search movies and examine results in the same method as above but are not able to save their searches, or upvote.

## Heroku

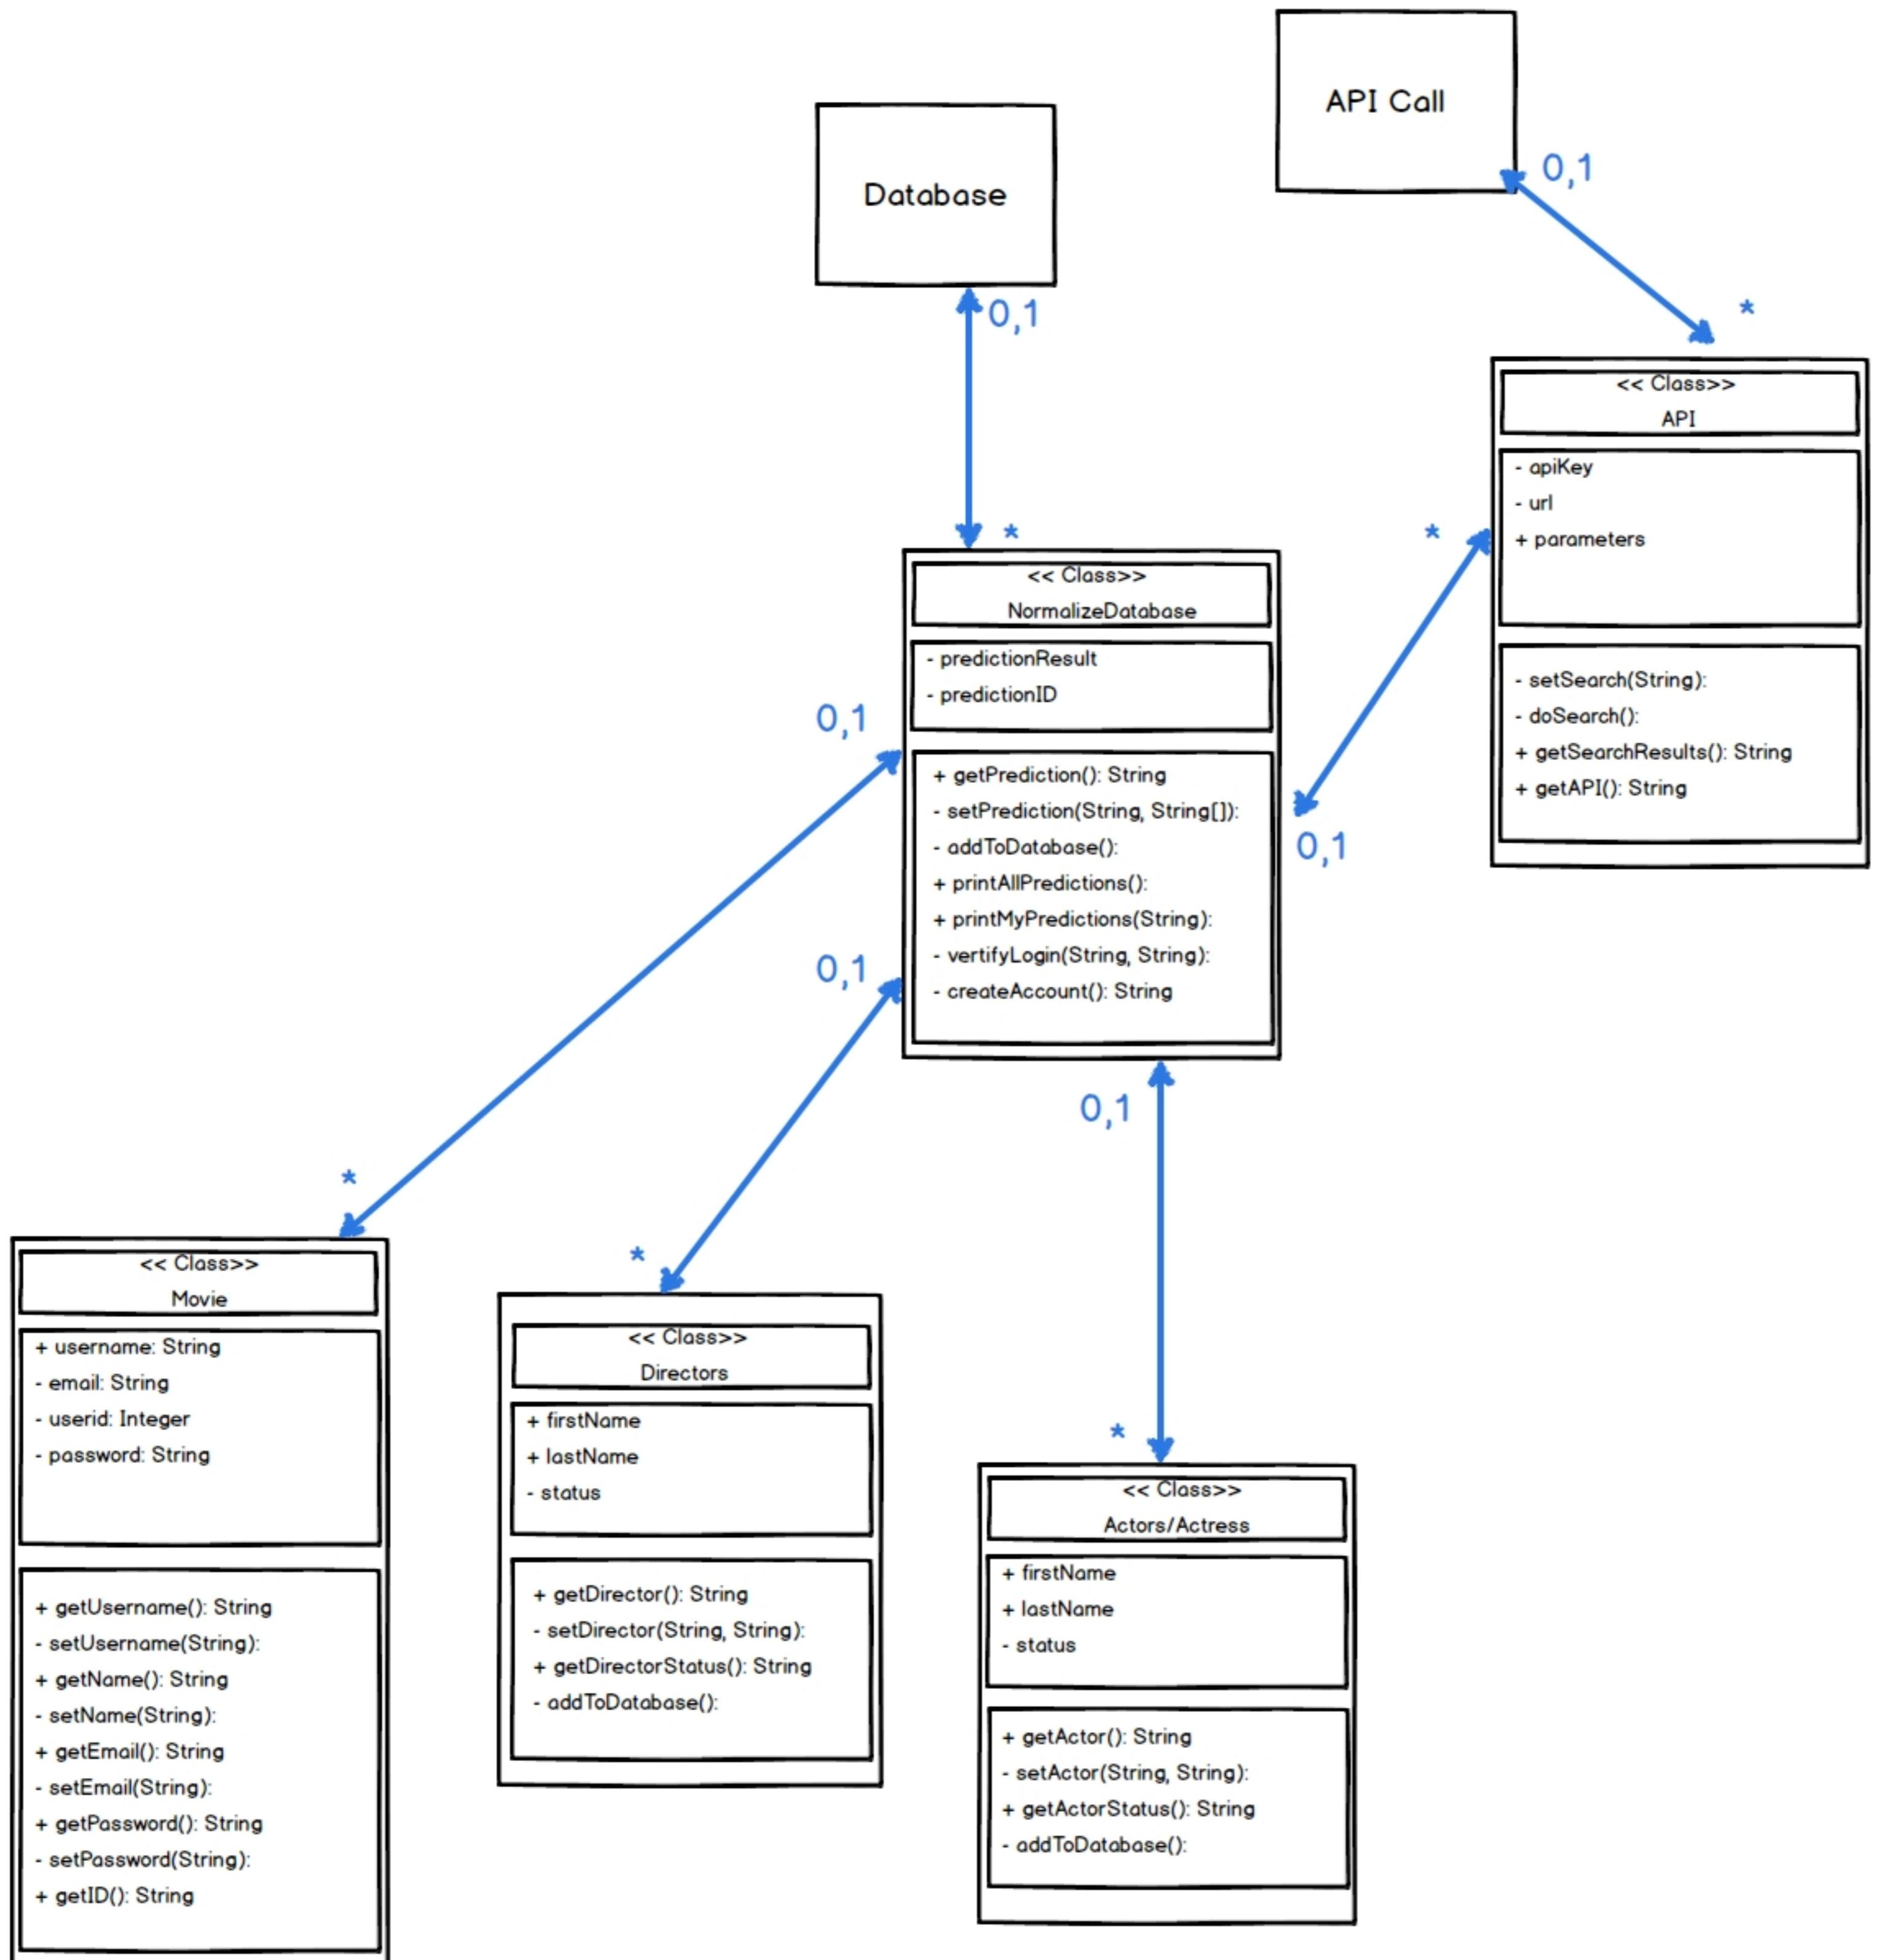

The above diagram demonstrates how the site will be able to interact with the different tables that are apart of our database.

Make as many classes as possible so we can get near 10

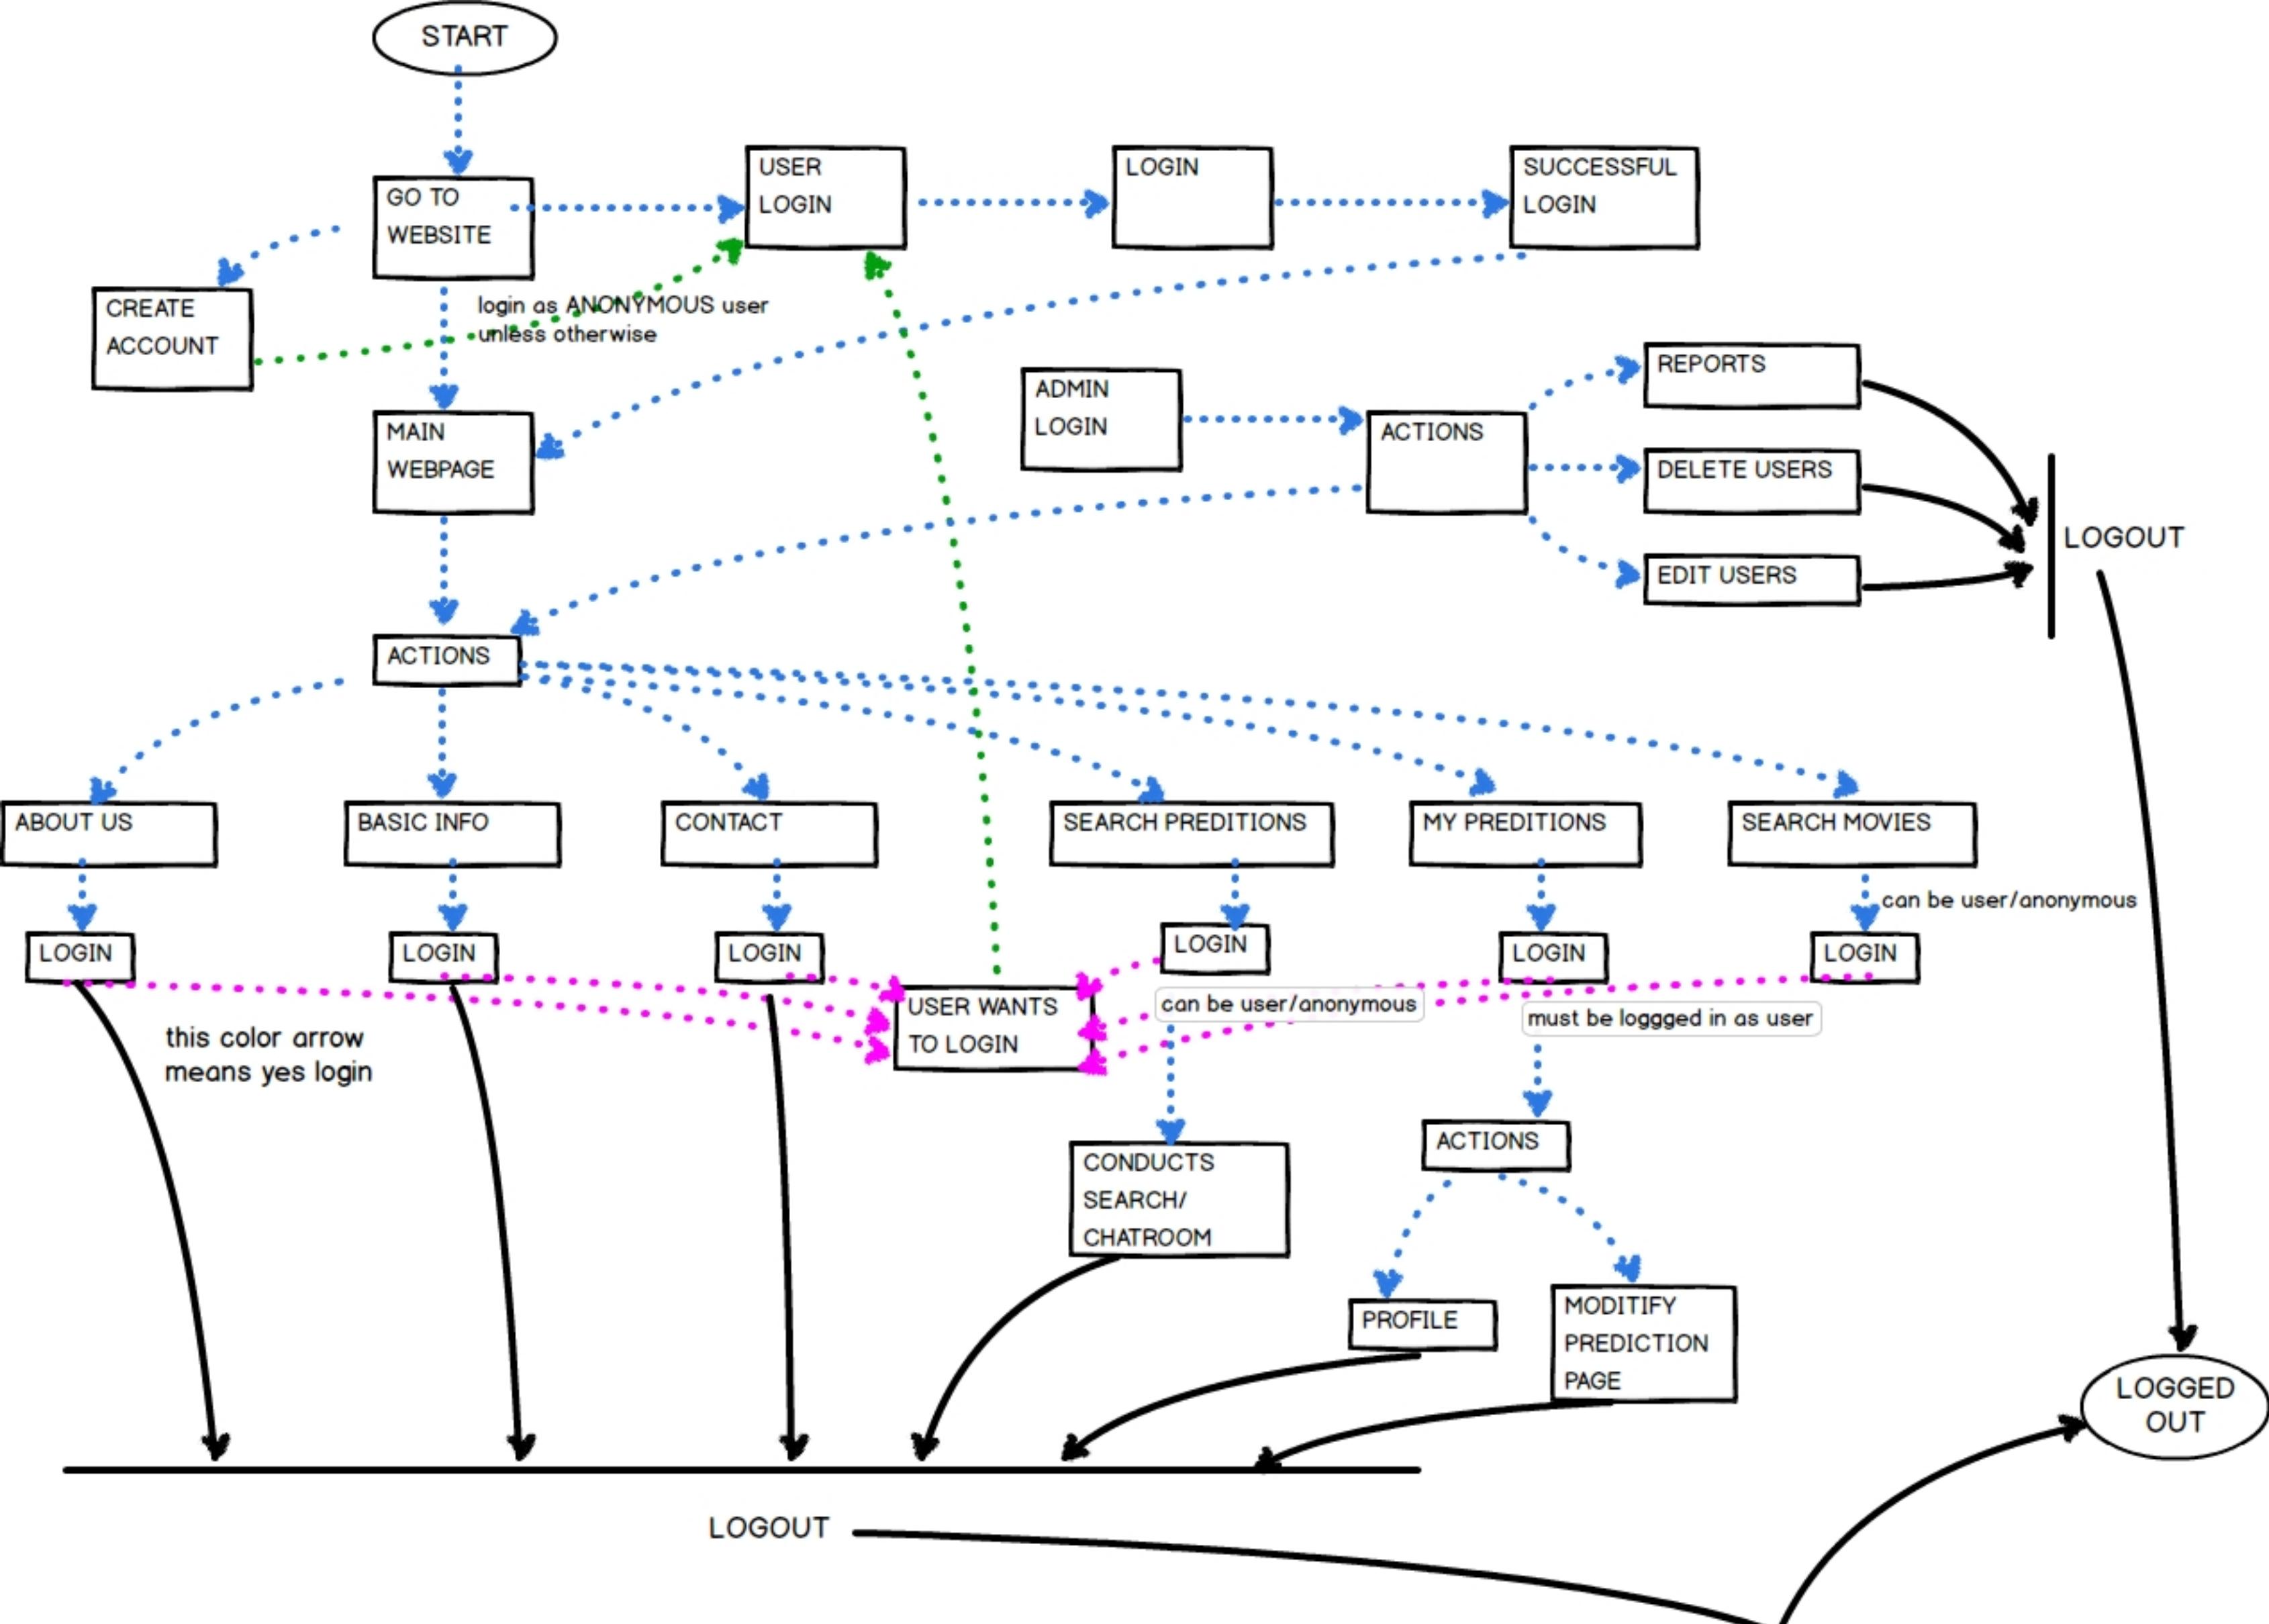

just guess what we might need ???

## Heroku

The above diagram demonstrates how the classes for determining the predictions of the movie's success will interact with not only the database but the api as well.

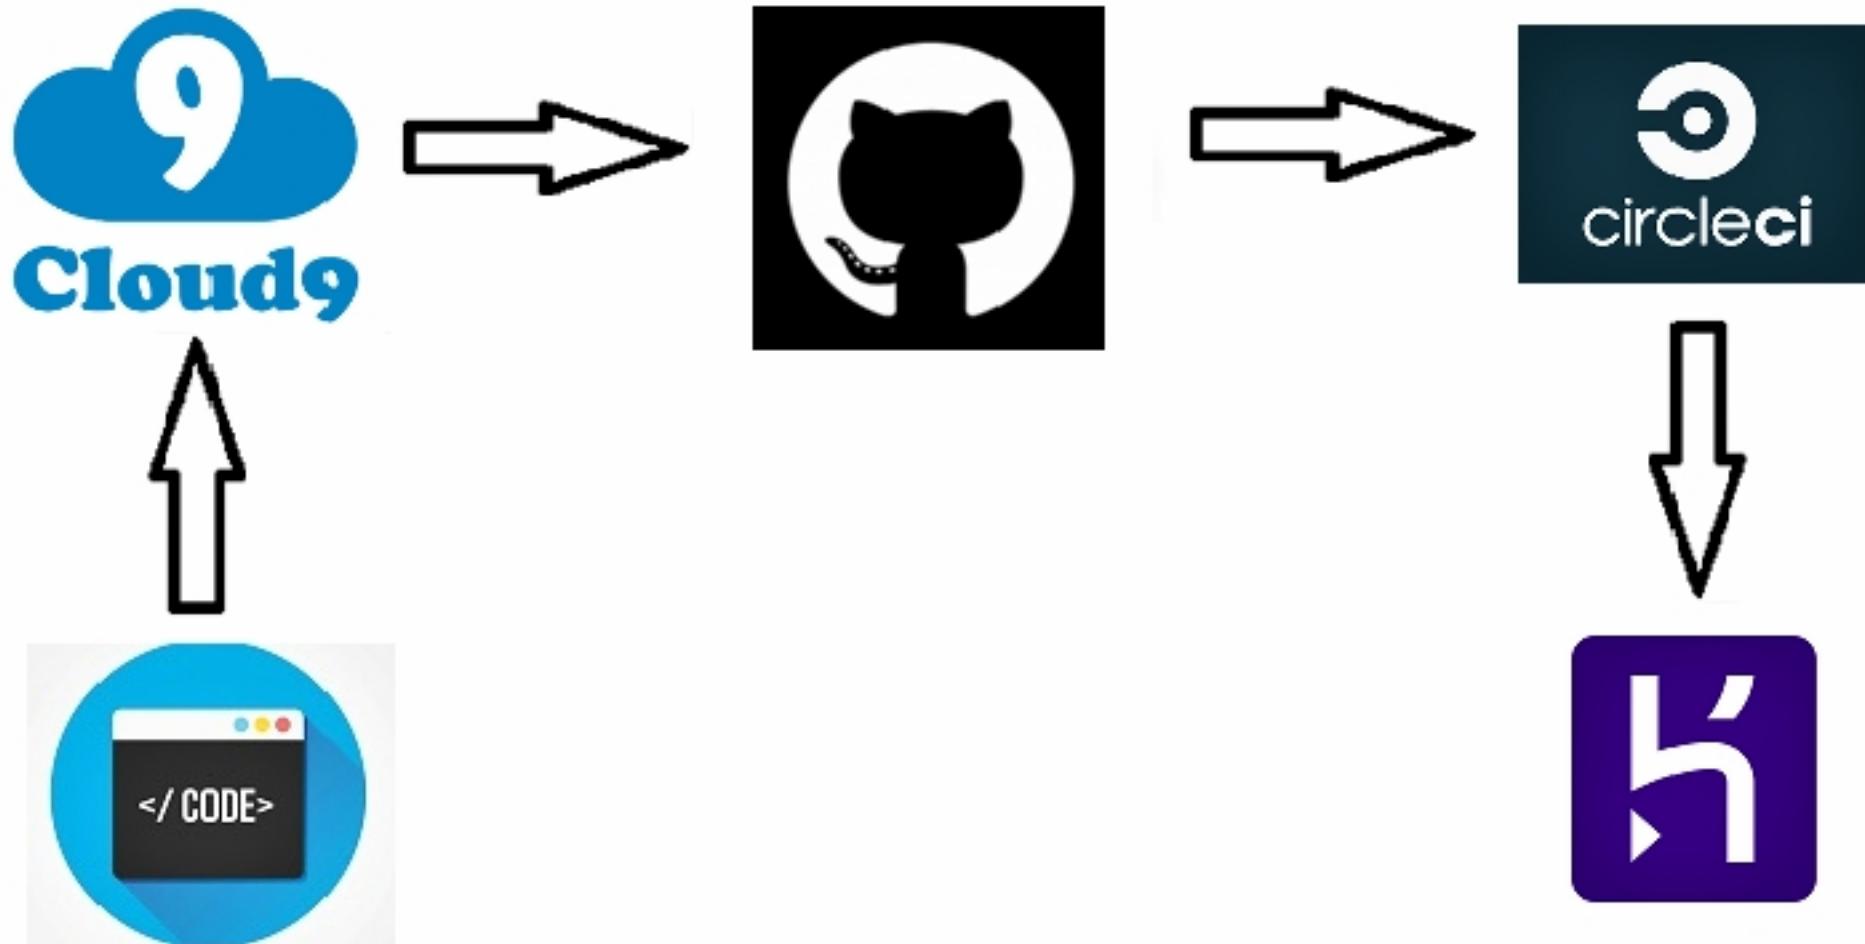

## Regie Daquioag - Overall Activity Diagram

### Overall Activity Diagram

Once the user enter the website, they are logged in as an anonymous user until they want to login into their account. At the home page the user can either make an account, go straight to the main, login in as a user or login as an admin. The admin has all the actions a user has but can also edit users, delete users, and view reports about the website. Once a user is on the wbsite they have many actions they can take such as go to the about us page, basic info page, contact page, search predictions, my predictions and search movies. An anonymous user cannot go to the mt predictions page if they are not logged in as a user. Lastly, the users can login and logout in any of the pages.
